Que. 11 **Direction:** Read the passage given below and answer the question that follows: (Q.No. 1 to 4)

Global warming is a term used for the observed century-scale rise in the average temperature of the Earth's climate system and its related effects. Scientists are more than 95% certain that nearly all of the global warming is caused by increasing concentrations of greenhouse gases (GHGs) and other human-caused emissions. Within the earth's atmosphere, accumulating greenhouse gases like water vapor, carbon dioxide, methane, nitrous oxide, and ozone are the gases within the atmosphere that absorb and emit heat radiation. Increasing or decreasing amounts of greenhouse gases within the atmosphere act to either hold in or release more of the heat from the sun. Our atmosphere is getting hotter, more **turbulent**, and more unpredictable because of the “boiling and churning” effect caused by the heat-trapping greenhouse gases within the upper layers of our atmosphere. With each increase of carbon, methane, or other greenhouse gas levels in the atmosphere, our local weather and global climate are further agitated, heated, and “boiled.”

What percentage of certainty is showed by scientists that nearly all of global warming is caused by increasing concentrations of greenhouse gases?

1. Less than 95%
2. Equal to 95%
